Dear Sebastian,

In the early summer of 2003, we agreed to purchase the ConTek Labsys program for Hot and Cold Mix Module and for the Soil and Aggregate Module. We had been searching for a program that will store all of our mix designs, test results, and data trending in one place and have them all linked together. Most of the programs that we reviewed did one or none of the tasks that we needed. We had been utilizing spreadsheets for this purpose with thousands of files stored all over the place. Data retrieval was always a problem with finding the needed file. Also, we had been entering the same information in two or three different spreadsheets to keep up with trending analysis. Thanks to Labsys for making all of this easy and with single keystrokes to save time.

The basic Labsys program seemed to meet most of these needs, but had to be modified to meet our specification requirements here in Louisiana. Of course there is no program that will meet all the needs of all the different specifications of each state or country. However, Contek worked very closely with us to modify the program and reports to meet our specific needs. We now have the program fully operational and are storing all of our data in the system.

We are pleased with the reports that are included in the system. We are looking forward to the next update which will include a report feature that will allow us to transfer data to another program such as Microsoft Excel and print reports from there.

Again, we want to thank all of you at Contek for all of your hard work into the program that we feel is the best on the present market. We also appreciate the personal attention you and your staff has given us over the past year to modify the program to meet our personal needs. Currently, the State of Louisiana is considering requiring the program as its standard program for Hot and Cold Mix Testing.

Thanks,

John W. Victory
